The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply							
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 11-14 and 17-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1 and 12 call for using a "power level". Dependent claims 11, and 17-20 require controlling a power. It is unclear if the power and power level are the same thing or not. And regardless as to whether they are the same, one would not be able to understand the claims because the suggest two mutually exclusive things: 1) using a constant power, and 2) using a variable power.

At line, 8 of claim 12: "power level selected" reads on a nebulous mental step conducted prior to the manipulative steps of the claimed process, hence rendering the present process claim unclear in meaning in scope. If applicant wishes to patent detail controls over the recited process, then the process steps must be positively recited.

See <u>Seagram & Sons Inc. vs Marzall, 84 USPQ 180</u>. This also applies to the selection of claims 19-20. In other words, the claim requires a mental step to get an intended result. It is questionable whether a potential competitor can avoid infringement by selecting the exact same power – but for another reason.

Application/Control Number: 09/890,366 Page 3

Claim Rejections - 35 USC § 103

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Art Unit: 1731

Claims 1, and 9-14 and 17-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kamijo 4556416.

The sole figure (and the associated text) of Kamijo discloses the step of supplying the reactants through ports 4 and 5 to a flame 9 and then irradiating the beam with a laser. Kamijo does not disclose the details regarding the particle nuclei, aggregates, growing, etc.

However, Kamijo discloses controlling the process via various parameters: col. 1, lines 60-63; col. 2, lines 65-68. It would have been obvious to perform routine experimentation to determine the optimal processing parameters – depending upon what sized particles are desired.

Art Unit: 1731

2144.05 [R-1] Obviousness of Ranges

See MPEP § 2131.03 for case law pertaining to rejections based on the anticipation of ranges under 35 U.S.C. 102 and 35 U.S.C. 102/103.

II. OPTIMIZATION OF RANGES

A. Optimization Within Prior Art Conditions or Through Routine Experimentation Generally, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical. "[W]here the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation." In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955) (Claimed process which was performed at a temperature between 40°C and 80°C and an acid concentration between 25% and 70% was held to be prima facie obvious over a reference process which differed from the claims only in that the reference process was performed at a temperature of 100°C and an acid concentration of 10%.); >see also Peterson, 315 F.3d at 1330, 65 USPQ2d at 1382 ("The normal desire of scientists or artisans to improve upon what is already generally known provides the motivation to determine where in a disclosed set of percentage ranges is the optimum combination of percentages.");< ** In re Hoeschele, 406 F.2d 1403, 160 USPQ 809 (CCPA 1969) (Claimed elastomeric polyurethanes which fell within the broad scope of the references were held to be unpatentable thereover because, among other reasons, there was no evidence of the criticality of the claimed ranges of molecular weight or molar proportions.). For more recent cases applying this principle, see Merck & Co. Inc. v. Biocraft Laboratories Inc., 874 F.2d 804, 10 USPQ2d 1843 (Fed. Cir.), cert. denied, 493 U.S. 975 (1989); In re Kulling, 897 F.2d 1147, 14 USPQ2d 1056 (Fed. Cir. 1990); and In re Geisler, 116 F.3d 1465, 43 USPQ2d 1362 (Fed. Cir. 1997). B. Only Result-Effective Variables Can Be Optimized A particular parameter must first be recognized as a result-effective variable, i.e., a variable which achieves a recognized result, before the determination of the optimum or workable ranges of said variable might be characterized as routine experimentation. In re Antonie, 559 F.2d 618, 195 USPQ 6 (CCPA 1977) (The claimed wastewater treatment device had a tank volume to contractor area of 0.12 gal./sq. ft. The prior art did not recognize that treatment capacity is a function of the tank volume to contractor ratio, and therefore the parameter optimized was not recognized in the art to be a resulteffective variable.). See also In re Boesch, 617 F.2d 272, 205 USPQ 215 (CCPA 1980) (prior art suggested proportional balancing to achieve desired results in the formation of an alloy).

In view of Applicant's disclosure, it is deemed that nothing special is required/done to achieve the formation of the aggregates, growing of particles, etc.

That it is merely picking the right location to irradiate the flame. It is deemed that routine experimentation with the Kamijo process will yield the right gas flow so that laser is irradiated into the aggregates as claimed.

It is deemed that claim 9-10 are met, since Kamijo does the same thing as applicant, one would expect to get the same sized particles.

Claim 11: col. 2, lines 65-68 discloses controlling the laser power. It is deemed that such controls the phase.

Claim 12 is clearly met.

Claim 13: See col. 2, lines 41-44: there is no indication as to where the filter is. It would have been obvious to have the filter right above the flame so as to collect the particles as soon as possible after leaving the chamber. Having the filter at a lower location would require more conduits, and thus more cost and require more space. It is also an obvious matter of design choice.

From MPEP 2144.04

C. Rearrangement of Parts

In re Japikse, 181 F.2d 1019, 86 USPQ 70 (CCPA 1950) (Claims to a hydraulic power press which read on the prior art except with regard to the position of the starting switch were held unpatentable because shifting the position of the starting switch would not have modified the operation of the device.); In re Kuhle, 526 F.2d 553, 188 USPQ 7 (CCPA 1975) (the particular placement of a contact in a conductivity measuring device was held to be an obvious matter of design choice).

Claim 14 is clearly met.

Claims 17-20: As indicated above, it would have been obvious to perform routine experimentation to determine the optimal power level – depending upon the desired particle characteristics.

Response to Arguments

Applicant's arguments filed 12 August 2005 have been fully considered but they are not persuasive.

It is argued that no adjustment of any parameter of the laser is contemplated. This is not persuasive: Col. 2, lines 65-68 of Kamijo discloses controlling heating by laser.

It is argued that Kamijo does not teach the wavelength – nor that such is a result effective variable. First Kamijo uses a carbon dioxide laser (col. 2, line17), just like applicant. More importantly, the rejection is not based on a selection of wavelength. Kamijo clearly uses the laser to heat the gas – just like some of Applicant's embodiments.

It is argued that Kamijo does not recongnize the concepts of aggregates. This is irrelevant. Such is inherent. See the equation on page 3 of applicant's specification – as well as the relevant discussion thereof.

It is still further argued that Kamijo does not recognize the concept of coalescence. This is not very relevant. The fact that applicant has recognized another advantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985). As per page 3, lines 6-9 of the present specification, coalescence merely requires the flame temperature be "realitively high". It is abundantly clear that Kamijo disclosure readily teaches the importance of a high flame temperature (added heat) to create improved

Art Unit: 1731

fine particles. In other words: the fact that applicant discovered the mechanism (i.e. coalesecence of inherent aggregates) by which adding additional heat creates a superior product does not warrant a patent – since Kamijo already discovered the advantage of adding heat. Kamijo need not be aware of the mechanism.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to John Hoffmann whose telephone number is (571) 272 1191. The examiner can normally be reached on Monday through Friday, 7:00- 3:30.

Art Unit: 1731

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Steve Griffin can be reached on 571-272-1189. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
